ELK 0601-0319

PRODUCT CATALOGUE

www.elkmotors.co.uk

A close-up photograph of the stator windings of a three-phase squirrel cage asynchronous motor. The image shows multiple slots in the stator core, each containing a dense, circular coil of copper wire. The copper has a warm, reddish-brown hue. The background is slightly blurred, emphasizing the intricate details of the winding process. A dark blue, semi-transparent geometric overlay is positioned in the center of the image, containing the title text.

**THREE PHASE SQUIRREL
CAGE ASYNCHRONOUS
MOTORS**

ELK Motor has been founded by major shareholders of Yılmaz Reduktor, as a continuation of the product family. ELK Motor manufactures electric motors from 71 up to 280 frame size in a 40.000m² closed area built on a 100.000 m² open area.

All motor series are designed and manufactured in accordance with European standards and in IE2 and IE3 efficiency classes.

The main design and technology of ELK Motor is completely suitable to the IE3 efficiency class. Since the outside dimensions of the IE3 and IE2 design are completely same, the replacement of the IE2 motor with IE3 motors will be done easily.

In addition to the motors according to the European standards, ELK Motor also manufactures special motors for its customers to decrease the cost and increase the productivity.

ELK Motors, from engineering to manufacturing processes, are completely manufactured in our factory located in Çerkezköy. Motor shafts and end shields are manufactured by fully automatic CNC machines under a continuous quality control. The rotor and stator cores are manufactured in our fully automatic punching and interlocking lines.

After injecting the pure aluminum into the rotor cores in a fully automatic rotor injection line, the rotor cores become ready for assembly. In automatic winding lines, stator cores are wound and varnished either by automatic dipping method or VPI [Vacuum Pressure Impregnation] method according to the needs and usage area. So the products are always in the best levels of quality and performance.

After all of these operations, our motors which are assembled in accordance with product prescriptions are being tested and controlled fully for the last time and shipped to the customers after packaging.

In addition, ELK Motor has the quality management system and final product certificates, that customers need. Our quality system is certified with ISO 9001 and our products have UL approval.

INFORMATION

IEC / EN / UL Compatibility

All of standard ELK Motors are designed, manufactured and tested according to the IEC and EN standards given below.

IEC 60034-1	Rating and performance
IEC 60034-2-1	Methods for determining losses and efficiency
IEC 60034-5	Classification of degrees of protection
IEC 60034-6	Methods of cooling
IEC 60034-7	Symbols of construction and mounting arrangements
IEC 60034-8	Terminal markings and direction of rotation
IEC 60034-9	Noise limits
IEC 60034-11	Built-in thermal protection
IEC 60034-14	Vibration limits
IEC 60034-18-1	Functional evaluation of insulation system
IEC 60034-30	Efficiency classes [IE Code]
IEC 60038	Standard voltages
EN 50347	Dimensions and output for electrical machines

EN 55014-1	Electromagnetic compatibility
EN 61000-3-2	
EN 61000-3-3	

UL1004-1	Rotating Electrical Machines – General Requirements
CSA C22.2 No. 100	Motors ve Generators

All of our motors, which have that UL logo on nameplate are approved by UL and manufactured according to UL1004-1 and CSA C22.2 No. 100 standards with E496161 file number.

According to IEC 60034-1, catalogue values are permitted to deviate from the real values as follows:

Speed (n)	$\Delta n = \pm 20\% (n_s - n_N), P_N > 1 \text{ kW}$ $\Delta n = \pm 30\% (n_s - n_N), P_N \leq 1 \text{ kW}$
Efficiency %(η)	$\Delta \eta = -15\% (100 - \eta_N), P_N \leq 150 \text{ kW}$ $\Delta \eta = -10\% (100 - \eta_N), P_N > 150 \text{ kW}$
Power Factor (Cos ϕ)	$\text{Cos } \phi = -1/6 (1 - \text{Cos } \phi)$
Locked rotor current (I_{LN})	$\Delta (I_{LN}) = +20\% (I_{LN})$
Starting torque (M_L/M_N)	min. $(M_L/M_N) = -15\% (M_L/M_N)$ max. $(M_L/M_N) = +25\% (M_L/M_N)$
Break down torque (M_K/M_N)	$(M_K/M_N) = -10\% (M_K/M_N)$
Moment of inertia (J) [kgm²]	$\Delta J = \pm 10\% J$
Sound pressure level (L_{PA}) [dB(A)]	$L_{PA} = +3 \text{ dB (A)}$

Mechanical Construction

71-160 frame size ELK Motors provides flexibility for different mounting types through their detachable feet which can be mounted on three sides. This feature allows terminal box assembly on the desired side. Terminal box is on the top for standard motors. 180-280 frame size motors have fixed feet construction.

MOTOR SIZE 71-160

MOTOR SIZE 180-280

Additionally the housing and end shields are designed symmetrically for all the frame sizes, so that the drive and non-drive side end shields can be replaced and the direction of the rotor shaft group can be changed. By making this end shields and rotor shaft group modifications, the user can have a motor with terminal box is at the non-drive side keeping the distance C according to the standards.

The raw materials that are used in our motors depending on the frame size are listed below.

Frame Size	Housing	End Shield DE	End Shield NDE	Terminal Box & Cover	Feet	Fan Cover	Fan

250	Cast Iron	Cast Iron	Cast Iron	Cast Iron	Cast Iron	Steel Sheet	Plastic
280	Cast Iron	Cast Iron	Cast Iron	Cast Iron	Cast Iron	Steel Sheet	Plastic

Electrical Construction

Standard ELK Motors have insulation Class F while the temperature rise is Class B. This means the motors will have a longer service life and work under hard conditions. Upon the customer's request, Class H insulation motors are manufactured.

Electrical Connections

Cable Gland and Blind Cap												
Frame Size	071	080	090	100	112	132	160	180	200	225	250	280

Blind Cap	M16x1,5			M25x1,5			-		-	-		-

Terminal Connections												
Frame Size	071	080	090	100	112	132	160	180	200	225	250	280
Terminal Size	M4			M5			M6			M8	M10	

The motors shall be connected in star or delta according to rated voltage given in their nameplate and the network voltage that they will be connected. For phase to phase 400V supply the motors with 230/400V nameplate values shall be connected in star and the motors with 400/690V nameplates values shall be connected in delta.

Y Star Connection

Δ Delta Connection

Motors at 60Hz Network

Standard ELK Motors that have been manufactured for 50 Hz power supply can be used at 60Hz network. The ratios given below indicate changes in the given rated values.

50 Hz Rated Voltage	60 Hz Rated Voltage	Rated Speed	Rated Power	Rated Torque	Rated Current	Starting Torque	Break Down Torque	Starting Current
230V	220V	1.193	1	0.84	0.97	0.77	0.8	0.8
400V	380V	1.193	1	0.84	0.97	0.77	0.8	0.8
400V	440V	1.20	1.16	0.97	0.98	0.87	0.9	0.9

Motors With Variable Speed Drives

Standard ELK Motors are suitable for variable speed drives. The frequency range that the motor can be driven with their fan is given below with blue line. If the motor will be driven in a wider range then a separately driven fan is necessary. By using a separately driven fan, the motors can be driven in the range defined by red line.

Motors In Several Environmental Conditions

ELK Motors are designed to operate at ambient temperature up to 40°C according to IEC 60034-1. Rated output will change at the % ratings given below for different ambient temperatures.

Ambient Temperature	<30 °C	35 °C	40 °C	45 °C	50 °C	55 °C	60 °C
% Power Ratio	105	102	100	97	93	87	82

Winding Insulation / Temperature Rise Classes

All standard motors in the ELK Motor range have F [155 °C] class electrical insulation system. However, by means of its superior design features, the temperature rise of all standard motors remain within the Class B temperature rise limits when operating under rated conditions. Depending on the safety margin of the temperature rise class provided, our motors can provide 15% higher rated output power with a service factor of 1.15 [SF].

INSULATION CLASS

Maximum Winding Temperature

Tolerance

Limits of Winding Temperature

Ambient Temperature

B 130°C

B

Class B insulation system is shown for reference purposes only. Class B insulation system is not used in ELK motors.

F 155°C

F (Standard)

Our standard motors have class F electrical insulation system. The maximum permissible winding temperature at 40°C ambient temperature is 155°C.

H 180°C

H (Optional)

H class insulation is provided on special request. At 40°C ambient temperature, the maximum permissible winding temperature is 180°C

Protection Classes

IP55 (Standard)

Limited protection against dust ingress and protected against low pressure water jets from any direction.

IP56

Limited protection against dust ingress and protected against high pressure water jets from any direction.

IP65

Totally protected against dust ingress and protected against low pressure water jets from any direction.

IP66

Totally protected against dust ingress and protected against high pressure water jets from any direction.

Construction Types

ELK Motors are manufactured according to International Mounting Standard IEC 60034-7.

Mounting codes and diagrams according to IEC 60034-7

Radial Loads

Radial Load [F_R]:

Radial load can be calculated according to below written formulae.

Calculated radial load must be below permissible radial loads given at tables.

If above, please contact with us.

$$F_R = k \cdot \frac{P}{D \cdot n} \cdot 10^7 \text{ (N)}$$

Correction of Permissible Radial Load

If the radial load is applied between points x_0 and x_{max} , the permissible radial load can be corrected with the following formulae.

$$Fr_x = Fr_0 - \frac{x}{E} (Fr_0 - Fr_{max})$$

P: Motor Power [kW]

D: Pulley Diameter [mm]

n: Motor speed [rpm]

k: Radial load factor

- Spur Gears, chain drives with low speed = 2,1
- Trigger Belts = 2,5
- V type belts = 5

$F_R < Fr_x$: Calculated radial load must be below permissible radial loads given at tables.

Fa: Axial load

Fr₀: Permissible radial load at shaft spigot.

Fr_{max}: Permissible radial load at shaft end point.

Permissible loads are calculated for L_{h10} 20000 h bearing lifetimes according to ISO 281.

F_{a0} : Permissible axial load

F_r : Radial load

F_{r0} : Permissible radial load at shaft spigot.

F_{rmax} : Permissible radial load at shaft end point.

Permissible loads are calculated for L_{h10} 20000 h bearing lifetimes according to ISO 281.

The image shows a factory floor with a red metal structure. Several large, grey electric motors are suspended from the ceiling by chains and hooks. In the foreground, a row of similar motors sits on a workbench. In the background, workers in dark clothing are visible, working on the machinery. The overall scene is industrial and brightly lit.

A wide-angle photograph of a large industrial factory floor. The ceiling is high with a complex network of steel beams and overhead power lines. In the foreground, there are several blue metal conveyor belts or workstations. One of them has a layer of brown, fibrous material on top. In the background, there are various pieces of industrial machinery, including a large white machine on the left and a yellow forklift in the center. The floor is a light-colored, polished concrete.

ADDITIONAL INFORMATION

Nameplate Description

- | | |
|-------------------------------------|---------------------|
| 1. Rated Voltage | 11. Rated Current |
| 2. Motor Type: 3 Phase Asynchronous | 12. Bearing Type |
| 3. Motor Code | 13. Serial Number |
| 4. Efficiency Class [IEC 60034-30] | 14. Efficiency |
| 5. Manufacture Standard | 15. Output Power |
| 6. Power Factor | 16. Speed |
| 7. Duty Cycle | 17. Frequency |
| 8. Protection Class | 18. Production Date |
| 9. Motor Weight | 19. UL Logo |
| 10. Insulation Class | 20. CE Mark |

The nameplate shows the identification, and the most important technical data. The nameplate also defines the limits of proper usage, and manufacturing year of the motors. The first two digits in the serial number, shows the manufacturing year. For example, 17XXXXXXX shows that the product is manufactured in 2017.

Spare Parts

2EL, 3EL, 2EC, 2EG, 3EG, 2ED Series motors consist of the following main parts;

- | | |
|--------------------|-------------------------|
| 1. Flange B5 | 14. Lifting Lug |
| 2. Flange B14 | 15. Terminal |
| 3. End Shield [DE] | 16. Terminal Box |
| 4. Shaft sealing | 17. Terminal Box Cover |
| 5. Screw | 18. Bolt |
| 6. Bearing | 19. Cable Gland |
| 7. Shaft | 20. Bearing |
| 8. Key | 21. Spring Washer |
| 9. Stator Core | 22. End Shield [NDE] |
| 10. Housing | 23. Fan |
| 11. Screw | 24. Fan cover |
| 12. Mounting foot | 25. Squirrel cage rotor |
| 13. Screw | 26. Winding |

When ordering spare parts, the motor serial number, full type designation, and product code, as stated on the nameplate, must be specified. For field service, spare parts and additional information, please contact with us.

PTC Thermistor and Thermal Switch

PTC Thermistor

If the motor is exposed to excessive load, the internal resistance of the thermistor attached to the motor windings increases due to the heating of the motor windings and opens the circuit when the insulation class limit value is reached. This prevents the winding from being damaged by cutting off the current in the windings. Only can be used with an electronic circuit.

Thermal Switch

When the motor is overloaded winding temperature exceeds the insulation class limit value, and the thermal switch assembled to the winding opens the circuit. In many applications, thermal switch can be connected in series to the main contactor coil.

Depending on the opening of the thermal switch, the main contactor is released and damage to the motor is prevented

Anti-Condensation Heater and Drain Hole

Water condensation inside the motor can occur in high humidity environments. To prevent this, heaters anti-condensation heaters are assembled to the motor windings to maintain a certain temperature.

In addition, drain holes are opened to prevent water from accumulating in the motor body in the event of water condensation inside the motor.

Non Drive End Shaft Extension and Canopy

Non Drive End Shaft Extension

Non drive end shaft is used when it is desired to transfer the motor power to a second load or to manually rotate it when the motor is not energized.

Canopy

It is used for operation in the outside environment where the motor fan is pointing upwards. This prevents the rainwater from entering the motor housing.

Brake, Hand Release, Separately Driven Fan Encoder and Backstop

Electromagnetic Brake

For each motor size we have the option of electromagnetic brake. Brakes with 24 Volt, 230 Volt and 400 Volt DC from 5Nm to 1600Nm are alternatively can be used as needed.

Brake with Hand Release

Hand release on the brake is used to release the system when the power is cut off or the power is not turned on.

Separately Driven Fan

Separately driven fan is used particularly in applications where the motor is driven by variable speed drives to keep the air flow at a constant level.

Separately Driven Fan with Encoder

In applications where synchronous operation is desired, encoder application is used. The motor fan cannot be used since the encoder is mounted on the non drive end cover. For this reason, the motor is cooled by a separately driven fan.

Separately driven fan with brake and encoder

In applications where both brake and synchronous operation are desired, brake, encoder and separately driven fan options are all mounted to the non drive side of the motor.

Backstop

Backstop is used when the motor should rotate only in one direction and the motor should not rotate in the other direction. The backstop option in the fan cover is widely used.

NOTES

Lined area for notes, consisting of approximately 40 horizontal lines.
